CC i- FUNCTION: probably plays a role in the formation and regulation of CC cells to the tight junction (TJ) paracellular permeability barrier, the tight junction (TJ) paracellular permeability barrier, composibly by linking ZO proteins to the actomyosin cytoskeleton. CC cells and ZO-3, myosin and cocludin in vitro, possibly cells on vivo, and ZO-3, myosin and cocludin in vitro, possibly cells cells.

CC directly. Acts as an F-actin bundling protein in vitro. CC directly. BecIFICITY: Localized on the cytoplasmic face of tight cells. CC cells beptihelia and some endothelia. Found in CC cells cells in the fertilized egg, where it is associated cells apical cortex in the fertilized egg, where it is associated with cytoskeleton filaments, it is recruited to tight junctions before ZO-1 and occludin. Nascent tight junctions are in place by the two-cell stage.

CC -- DOWAIN: Deletion of the ZO-1 interaction motif (ZIM) decreases but CC -- DOWAIN: Deletion of the ZO-1 interaction with ZO-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cordenonsi M., D'Atri F., Hammar E., Parry I

SIMILARITY: Contains 1 DDT domain.

SIMILARITY: Contains 1 methyl-binding (MBD) domain.

SIMILARITY: Contains 1 PHD-type zinc finger.

CAUTION: Ref.5 sequence differs from that shown due frameshift in position 731.

Interacts with TUFI/ZO-1. SUBUNIT: Homodimer (By similarity). Interacts with TUFI/ZO-1. TISSUE SPECIFICITY: Localized on the cytoplasmic face of tight punctions of polarized epithelia and some endothelia. Expressed junctions of polarized epithelia and some endothelia. Expressed junctions, kidney, liver and lung, but not in skeletal muscle, pancreas, kidney, liver and lung, but not in skeletal muscle, placenta, brain or heart.

DOMAIN: Deletion of the ZO-1 interaction motif (ZIM) decreases b does not abolish colocalization with ZO-1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SUBUNIT: Forms a complex with mrell (By similarity). SIMILARITY: Belongs to the SMC family. RAD50 subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    FUNCTION: Involved in DNA double-strand break repair (DSBR). The rad50/mrell complex possesses single-strand endonuclease activity and ATP-dependent double-strand-specific exonuclease activity. Rad50 provides an ATP-dependent control of mrell by unwinding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           complete genome

                                                                                                                                                                                                                                                                                                                                                                                                                                            PUNCTION: May regulate actin cytoskeletal organization, cell spreading and cell contraction by directly binding and stabil: spreading and cell contraction by directly binding and stabil: filamentous F-actin. The localized formation of TARA and TRIO complexes coordinates the amount of F-actin present in stress fibers. May also serve as a linker protein to recruit proteins required for F-actin formation and turnover. SUBUNIT: Binds to TRIO and F-actin. May also interact with mycrosum.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NCBI_TaxID=9986;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FUNCTION: Intermediate filament-associated protein that associates in regular arrays with keratin intermediate filaments (KIF) of the inner root sheath cells of the hair follicle and the granular layer of the epidermis. It later becomes cross-linked to KIF by isodipeptide bonds. It may serve as scaffold protein, together with involucrin, in the organization of the cell envelope or even anchor the cell envelope to the KIF network. It may be involved in its own calcium-dependent postsynthetic processing during remning differentiation

Domains 2-4, 6, and 8 are almost entirel alpha-helical, configured as a series of peptide repeats of varying regularity, and are thought to form a single-stranded alpha-helical rod stabilized by ionic interactions. Domain 6 is the most regular and may bind KIF directly by ionic interactions. Domains 5 and 7 are less well organized and may induce folds in the molecule. Domain 9 contains the C-terminus, conserved among

Characteristic for alpha-helical coiled coils. The sequence of the actin-activated Affase activity.

MISCELLANEOUS: Dictyostelium myosin II has no K(2)EDTA AFFase activity, perhaps correlated with the absence of a Cys at the SH-1 position (688).

SIMILARITY: Contains 1 myosin-like globular head domain.

SIMILARITY: Contains 1 IQ domain.
                                                                                                                                                                                                                                                                                                                                                                                                   DOMAIN: Each myosin heavy chain can be split into 1 light meromyosin (LMM) and 1 heavy meromyosin (HMM). It can be further split into 2 globular subfragments (S1) and 1 rod-shaped subfragment (S2).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SUBCELLULAR LOCATION: HIGHEST CONCENTRATION IN THE

SUBCELULIAR LOCATION: Thick filaments of the myofibrils.

DOMAIN: The rodlike tail sequence is highly repetitive, showing cycles of a 28-residue repeat pattern composed of 4 heptapeptides, characteristic for alpha-helical coiled coils.

MISCELLANEOUS: Each myosin heavy chain can be split into 1 light meromyosin (LMM) and 1 heavy meromyosin (HMM). It can later be split further into 2 globular subfragments (S1) and 1 rod-shaped subfragment (S2).

SIMILARITY: Contains 1 myosin-like globular head domain.

SIMILARITY: Contains 1 IQ domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ween the Swiss Institute of Bioinf

   FUNCTION: Intermediate filament-associated protein that associated in regular arrays with keratin intermediate filaments (KIF) of the inner root sheath cells of the hair follicle and the granular layer of the epidermis. It later becomes cross-linked to KIF by isodipeptide bonds. It may serve as scaffold protein, together with involucrin, in the organization of the cell envelope or even

Some 200 arginines probably converted to citrullines by peptidylarginine similarity: In the N-terminal section; belongs to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        calcium-binding domains. Domains 2-4, 6, and 8 are almost entirely alpha-helical, configured as a series of peptide repeats of varying regularity, and are thought to form a single-stranded alpha-helical rod stabilized by ionic interactions. Domain 6 is the most regular and may bind KIF directly by ionic interactions. Domains 5 and 7 are less well organized and may induce folds in the molecule. Domain 9 contains the C-terminus, conserved among the molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TISSUE SPECIFICITY: Found in the hard keratinizing tissues such the inner root sheath (IRS) of hair follicles and medulla, and the filiform papillae of dorsal tongue epithelium (Probable). DEVELOPMENTAL STAGE: Expressed during late differentiation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SIMILARITY: Contains 2 EF-hand calcium-binding domains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DOMAIN: Consists of nine domains. Domain 1 contains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                different species.

SUBCELLULAR LOCATION: Thick filaments of the myofibrils. DOMAIN: The rodlike tail sequence is highly repetitive, showing cycles of a 28-residue repeat pattern composed of 4 heptapeptides, characteristic for alpha-helical coiled coils. MISCELLANEOUS: Each myosin heavy chain can be split into 1 light mercomyosin (LMM) and 1 heavy mercomyosin (HMM). It can later be split further into 2 globular subfragments (S1) and 1 rod-shaped
